CO2 capture, utilization and storage

Dunkirk, May 27, 2019

A consortium of 11 European stakeholders including ArcelorMittal, Axens, IFP Energies nouvelles (IFPEN) and Total, is launching a project today to demonstrate an innovative process for capturing CO₂ from industrial activities—the DMX™ project. It is part of a more comprehensive study dedicated to the development of the future European Dunkirk North Sea Capture and Storage Cluster.

The “3D” project (for DMX™ Demonstration in Dunkirk) is part of Horizon 2020, the European Union’s research and innovation program. The project has a 19.3-million-euro budget over 4 years, including 14.8 million euros in European Union subsidies. Coordinated by IFPEN, the “3D” project brings together other 10 partners from research and industry from 6 European countries: ArcelorMittal, Axens, Total, ACP, Brevik Engineering, CMI, DTU, Gassco, RWTH and Uetikon.

The objective is threefold:

- **Demonstrate the effectiveness of the DMX™ process on a pilot industrial scale.**
The pilot, designed by Axens, will be built starting in 2020 at the ArcelorMittal steelworks site in Dunkirk and will be able to capture 0.5 metric tons of CO₂ an hour from steelmaking gases by 2021.
The DMX™ process, a patented process stemming from IFPEN's Research and to be marketed by Axens, uses a solvent that reduces the energy consumption for capture by nearly 35% compared to the reference process. Additionally, using the heat produced on site will cut capture costs in half, to less than 30 euros per metric ton of CO₂.
- **Prepare the implementation of a first industrial unit** at the ArcelorMittal site in Dunkirk, which could be operational starting in 2025. It should be able to capture more than 125 metric tons of CO₂ an hour, i.e. more than one million metric tons of CO₂ a year.
- **Design the future European Dunkirk North Sea Cluster, which should be able to capture, pack, transport and store 10 million metric tons of CO₂ a year and should be operational by the year 2035.** This cluster will be backed up by the packing and transport infrastructures for storing CO₂ in the North Sea developed by other projects such as the Northern Lights project⁽¹⁾ that Total is already involved in.

The “3D” project's ambition is to validate replicable technical solutions and to achieve industrial deployment of Capture & Storage technology around the world. It should play a major role in enabling industries with high energy consumption and CO₂ emissions, such as the steel industry, to reduce their emissions. This project is an essential lever for meeting the targets of the Paris Agreement on global warming.

CO₂ capture and the Carbon Capture & Storage (CCS) process

Capture consists in extracting the CO₂ produced by large polluting industrial units, then putting it under pressure before injecting it into a geological storage area. In post-combustion capture, the CO₂ is separated from other gases by absorption in a chemical solvent. Currently, the challenge facing research is to significantly increase the energy performances in this stage, the costliest part of the CSC process, to make this process more competitive.
